## 🚀 Your First AI Agent: From Prompt to Action

Welcome to the Kaggle 5-day Agents course!

This notebook is your first step into building AI agents. An agent can do more than just respond to a prompt — it can **take actions** to find information or get things done.

In this notebook, you'll:

- Install Agent Development Kit (ADK)
- Configure your API key to use the Gemini model
- Build your first simple agent
- Run your agent and watch it use a tool (like Google Search) to answer a question

### !! Please Read

**Note: No submission required!** This notebook is for your hands-on practice and learning only. You **do not** need to submit it anywhere to complete the course.

**Note:** When you first start the notebook via running a cell you might see a banner in the notebook header that reads "**Waiting for the next available notebook**". The queue should drop rapidly; however, during peak bursts you might have to wait a few minutes.

**Note:** Avoid using the **Run all** cells command as this can trigger a QPM limit resulting in 429 errors when calling the backing model. Suggested flow is to run each cell in order - one at a time. See FAQ on 429 errors for more information.

For help: Ask questions on the [Kaggle Discord server](#).

## 📘 Get started with Kaggle Notebooks

If this is your first time using Kaggle Notebooks, welcome! You can learn more about using Kaggle Notebooks in the documentation.

Here's how to get started:

### 1. Verify Your Account (Required)

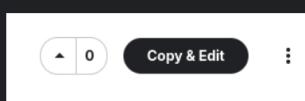

To use the Kaggle Notebooks in this course, you'll need to verify your account with a phone number.

You can do this in your [Kaggle settings](#).

### 2. Make Your Own Copy

To run any code in this notebook, you first need your own editable copy.

Click the **Copy** and **Edit** button in the top-right corner.

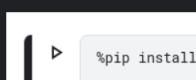

This creates a private copy of the notebook just for you.

### 3. Run Code Cells

Once you have your copy, you can run code.

Click the **Run** button next to any code cell to execute it.

Run the cells in order from top to bottom.

### 4. If You Get Stuck

To restart: Select **Factory reset** from the **Run** menu.

For help: Ask questions on the [Kaggle Discord server](#).

## 💡 Section 1: Setup

### 1.1: Install dependencies

The Kaggle Notebooks environment includes a pre-installed version of the `google-adk` library for Python and its required dependencies, so you don't need to install additional packages in this notebook.

To install and use ADK in your own Python development environment outside of this course, you can do so by running:

```
pip install google-adk
```

### 1.2: Configure your Gemini API Key

This notebook uses the [Gemini API](#), which requires authentication.

#### 1. Get your API key

If you don't have one already, create an [API key in Google AI Studio](#).

#### 2. Add the key to Kaggle Secrets

Next, you will need to add your API key to your Kaggle Notebook as a Kaggle User Secret.

1. In the top menu bar of the notebook editor, select `Add-ons` then `Secrets`.
2. Create a new secret with the label `GOOGLE_API_KEY`.
3. Paste your API key into the "Value" field and click "Save".
4. Ensure that the checkbox next to `GOOGLE_API_KEY` is selected so that the secret is attached to the notebook.

#### 3. Authenticate in the notebook

Run the cell below to complete authentication.

```
[1]:  
import os  
from kaggle_secrets import UserSecretsClient  
  
try:  
    GOOGLE_API_KEY = UserSecretsClient().get_secret("GOOGLE_API_KEY")  
    os.environ["GOOGLE_API_KEY"] = GOOGLE_API_KEY  
    print("✅ Gemini API key setup complete.")  
except Exception as e:  
    print(  
        f"⚠️ Authentication Error: Please make sure you have added 'GOOGLE_API_KEY' to your Kaggle secrets. Details: {e}"  
    )  
  
✅ Gemini API key setup complete.
```

### 1.3: Import ADK components

Now, import the specific components you'll need from the Agent Development Kit and the Generative AI library. This keeps your code organized and ensures we have access to the necessary building blocks.

```
[2]:  
from google.adk.agents import Agent  
from google.adk.models.google_llm import Gemini  
from google.adk.runners import InMemoryRunner  
from google.adk.tools import google_search  
from google.genai import types  
  
print("✅ ADK components imported successfully.")  
  
✅ ADK components imported successfully.
```

### 1.4: Helper functions

We'll define some helper functions. If you are running this outside the Kaggle environment, you don't need to do this.

```
[5]:  
# Define helper functions that will be reused throughout the notebook  
  
from IPython.core.display import display, HTML  
from jupyter_server.serverapp import list_running_servers  
  
# Gets the proxied URL in the Kaggle Notebooks environment  
def get_adk_proxy_url():  
    PROXY_HOST = "https://kkg-production.jupyter-proxy.kaggle.net"  
    ADK_PORT = "8000"  
  
    servers = list(list_running_servers())  
    if not servers:  
        raise Exception("No running Jupyter servers found.")  
  
    baseURL = servers[0]["base_url"]  
  
    try:  
        path_parts = baseURL.split("/")  
        kernel = path_parts[2]  
        token = path_parts[3]  
    except IndexError:  
        raise Exception(f"Could not parse kernel/token from base URL: {baseURL}")  
  
    url_prefix = f"/k/{kernel}/{token}/proxy/proxy/{ADK_PORT}"
```

```

url = f'{PROXY_HOST}{url_prefix}'

styled_html = f"""
<div style='padding: 15px; border: 2px solid #f0ad4e; border-radius: 8px; background-color: #fef9f0; margin: 20px 0;'>
    <div style="font-family: sans-serif; margin-bottom: 12px; color: #333; font-size: 1.1em;">
        <strong>⚠️ IMPORTANT: Action Required</strong>
    </div>
    <div style="font-family: sans-serif; margin-bottom: 15px; color: #333; line-height: 1.5;">
        The ADK web UI is <strong>not running yet</strong>. You must start it in the next cell.
    <ol style="margin-top: 10px; padding-left: 20px;">
        <li style="margin-bottom: 5px;"><strong>Run the next cell</strong> (the one with <code>!adk web ...</code>) to start the ADK web UI.</li>
        <li style="margin-bottom: 5px;">Wait for that cell to show it is "Running" (it will not "complete").</li>
        <li>Once it's running, <strong>return to this button</strong> and click it to open the UI.</li>
    </ol>
    <em style="font-size: 0.9em; color: #555;">(If you click the button before running the next cell, you will get a 500 error.)</em>
</div>
<a href='{url}' target='_blank' style="display: inline-block; background-color: #1a73e8; color: white; padding: 10px 20px; text-decoration: none; border-radius: 25px; font-family: sans-serif; font-weight: 500; box-shadow: 0 2px 5px rgba(0,0,0,0.2); transition: all 0.2s ease;">
    Open ADK Web UI (after running cell below)
</a>
</div>
"""

display(HTML(styled_html))

return url_prefix

```

print("✅ Helper functions defined.")

✅ Helper functions defined.

## 1.5: Configure Retry Options

When working with LLMs, you may encounter transient errors like rate limits or temporary service unavailability. Retry options automatically handle these failures by retrying the request with exponential backoff.

```
[8]: retry_config=types.HttpRetryOptions(
    attempts=5, # Maximum retry attempts
    exp_base=1, # Delay multiplier
    initial_delay=1, # Initial delay before first retry (in seconds)
    http_status_codes=[429, 500, 503, 504] # Retry on these HTTP errors
)
```

## 💡 Section 2: Your first AI Agent with ADK

### 💡 2.1 What is an AI Agent?

You've probably used an LLM like Gemini before, where you give it a prompt and it gives you a text response.

Prompt -> LLM -> Text

An AI Agent takes this one step further. An agent can think, take actions, and observe the results of those actions to give you a better answer.

Prompt -> Agent -> Thought -> Action -> Observation -> Final Answer

In this notebook, we'll build an agent that can take the action of searching Google. Let's see the difference!

## 2.2 Define your agent

Now, let's build our agent. We'll configure an `Agent` by setting its key properties, which tell it what to do and how to operate.

To learn more, check out the documentation related to [agents in ADK](#).

These are the main properties we'll set:

- **name** and **description**: A simple name and description to identify our agent.
- **model**: The specific LLM that will power the agent's reasoning. We'll use "gemini-2.5-flash-lite".
- **instruction**: The agent's guiding prompt. This tells the agent what its goal is and how to behave.
- **tools**: A list of `tools` that the agent can use. To start, we'll give it the `google_search` tool, which lets it find up-to-date information online.

```
[9]: root_agent = Agent(
    name="helpful_assistant",
    model=Gemini(
        model="gemini-2.5-flash-lite",
        retry_options=retry_config
    ),
    description="A simple agent that can answer general questions.",
    instruction="You are a helpful assistant. Use Google Search for current info or if unsure.",
    tools=[google_search],
)

print("✅ Root Agent defined.")
```

✅ Root Agent defined.

## 2.3 Run your agent

Now it's time to bring your agent to life and send it a query. To do this, you need a `Runner`, which is the central component within ADK that acts as the orchestrator. It manages the conversation, sends our messages to the agent, and handles its responses.

- a. Create an `InMemoryRunner` and tell it to use our `root_agent`:

```
[10]: runner = InMemoryRunner(agent=root_agent)
print("Runner created.")

Runner created.
```

👉 Note that we are using the Python Runner directly in this notebook. You can also run agents using ADK command-line tools such as `adk run`, `adk web`, or `adk api_server`. To learn more, check out the documentation related to `runtime` in ADK.

- b. Now you can call the `.run_debug()` method to send our prompt and get an answer.

👉 This method abstracts the process of session creation and maintenance and is used in prototyping. We'll explore "what sessions are and how to create them" on Day 3.

```
[11]: response = await runner.run_debug(
    "What is Agent Development Kit from Google? What languages is the SDK available in?"
)
```

```
### Created new session: debug_session_id

User > What is Agent Development Kit from Google? What languages is the SDK available in?
helpful_assistant > The Agent Development Kit (ADK) from Google is a flexible and modular framework designed to simplify the development, deployment, and orchestration of AI agents and multi-agent systems. It applies software development principles to AI agent creation, allowing developers to build production-ready agentic applications with greater control and precision. ADK is model-agnostic and deployment-agnostic, meaning it can be used with various models and deployed in different environments, though it is optimized for the Google ecosystem, particularly Gemini models and Vertex AI.

The ADK aims to make agent development more like traditional software development, enabling robust debugging, versioning, and deployment. It supports building complex agent architectures, from simple tasks to intricate workflows, and allows for the integration of diverse tools and custom functions.

The SDK is currently available in the following languages:
* **python**
* **Java**
* **Go**

Support for more languages is expected to be added in the future.
```

You can see a summary of ADK and its available languages in the response.

## 2.4 How does it work?

The agent performed a Google Search to get the latest information about ADK, and it knew to use this tool because:

1. The agent inspects and is aware of which tools it has available to use.
2. The agent's instructions specify the use of the search tool to get current information or if it is unsure of an answer.

The best way to see the full, detailed trace of the agent's thoughts and actions is in the **ADK web UI**, which we'll set up later in this notebook.

And we'll cover more detailed workflows for logging and observability later in the course.

## 🚀 2.5 Your Turn!

This is your chance to see the agent in action. Ask it a question that requires current information.

Try one of these, or make up your own:

- What's the weather in London?
- Who won the last soccer world cup?
- What new movies are showing in theaters now?

```
[13]: response = await runner.run_debug("What's the weather in London?")
```

```
### Continue session: debug_session_id

User > What's the weather in London?
helpful_assistant > The weather in London is currently cloudy with a temperature of 51°F (11°C). There is a 95% humidity, and it feels like 48°F (9°C). The chance of rain is around 0% right now.
```

For the rest of Tuesday, it is expected to be cloudy during the day with a chance of rain at night. The temperature will range between 51°F (11°C) and 58°F (14°C).

Looking ahead, the forecast for the next few days includes light rain and cloudy conditions with temperatures generally in the 50s Fahrenheit.

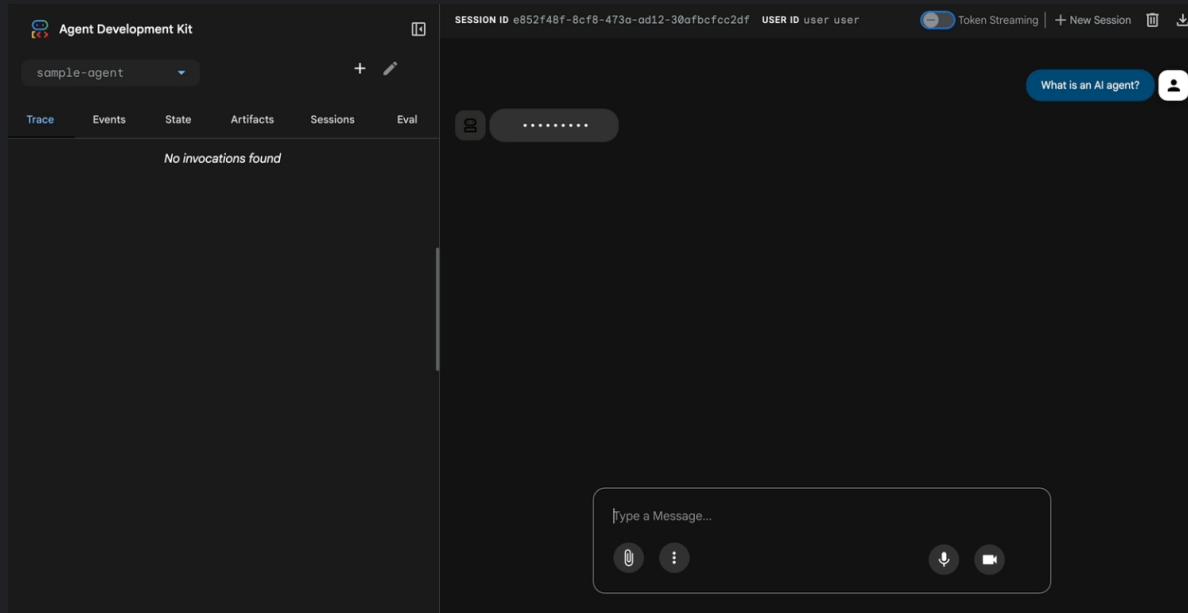

---

## ▀ Section 3: Try the ADK Web Interface

[Overview](#)

## Overview

ADK includes a built-in web interface for interactively chatting with, testing, and debugging your agents.

To use the ADK web UI, you'll need to create an agent with Python files using the `adk create` command.

Run the command below to generate a `sample-agent` folder that contains all the necessary files, including `agent.py` for your code, an `.env` file with your API key pre-configured, and an `__init__.py` file:

```
[15]: !adk create sample-agent --model gemini-2.5-flash-lite --api_key $GOOGLE_API_KEY
```

```
Agent created in /kaggle/working/sample-agent:  
- .env  
- __init__.py  
- agent.py
```

Get your custom URL to access the ADK web UI in the Kaggle Notebooks environment:

```
[16]: url_prefix = get_adk_proxy_url()
```

### ⚠️ IMPORTANT: Action Required

The ADK web UI is **not running yet**. You must start it in the next cell.

1. Run the **next cell** (the one with `!adk web ...`) to start the ADK web UI.
2. Wait for that cell to show it is "Running" (it will not "complete").
3. Once it's running, **return to this button** and click it to open the UI.

(If you click the button before running the next cell, you will get a 500 error.)

[Open ADK Web UI \(after running cell below\)](#)

Now we can run ADK web:

```
[1]: !adk web --url_prefix {url_prefix}  
  
/usr/local/lib/python3.11/dist-packages/google/adk/cli/fast_api.py:130: UserWarning: [EXPERIMENTAL] InMemoryCredentialService: This feature is experimental and may change or be removed in future versions without notice. It may introduce breaking changes at any time.  
    credential_service = InMemoryCredentialService()  
/usr/local/lib/python3.11/dist-packages/google/adk/auth/credential_service/in_memory_credential_service.py:33: UserWarning: [EXPERIMENTAL] BaseCredentialService: This feature is experimental and may change or be removed in future versions without notice. It may introduce breaking changes at any time.  
    super().__init__()  
INFO:     Started server process [147]  
INFO:     Waiting for application startup.  
  
+-----+  
| ADK Web Server started  
|  
| For local testing, access at http://127.0.0.1:8000.  
+-----+

```

Now you can access the ADK dev UI using the link above.

Once you open the link, you'll see the ADK web interface where you can ask your ADK agent questions.

Note: This sample agent does not have any tools enabled (like Google Search). It is a basic agent designed specifically to let you explore the UI features.

**!! IMPORTANT: DO NOT SHARE THE PROXY LINK** with anyone - treat it as sensitive data as it contains your authentication token in the URL.

---

## ✓ Congratulations!

You've built and run your first agent with ADK! You've just seen the core concept of agent development in action.

The big takeaway is that your agent didn't just *respond*—it **reasoned** that it needed more information and then **acted** by using a tool. This ability to take action is the foundation of all agent-based AI.

**💡 Note: No submission required!**

This notebook is for your hands-on practice and learning only. You **do not** need to submit it anywhere to complete the course.

## 📚 Learn More

Refer to the following documentation to learn more:

- ADK Documentation
- ADK Quickstart for Python
- ADK Agents Overview
- ADK Tools Overview

## ⌚ Next Steps

Ready for the next challenge? Continue to the next notebook to learn how to **architect multi-agent systems**.
